

The agent gets a **session wallet** with a fixed budget.

One tap funds it. When the task ends, everything sweeps back. The vault key never leaves the device. The agent runs autonomously within what you approved — and only what you approved.

- 01 **Fresh keypair** generated on the device per agent connection
- 02 **Card tap** funds it via Telegram deep link (HMAC-signed)
- 03 **Auto-sweep** on task end. Residual SOL + USDC back to vault

Built solo. Shipped end-to-end. Real USDC moved on every step.

x402

Full agent payment loop. Self-documenting 402 endpoint.

3

Agent · Personal · Burner.
All card-tap funded.

< 500_{MS}

Reconstruct, sign, wipe. Nothing persisted,
anywhere.

< 4_{WK}

Crypto, NFC, mobile, agent skill, signal server.

Full hardware wallet - SOL + USDC, Jupiter swap, QR scanner

Agent lifecycle - fund → task → return, on-chain confirmed

x402 signal server - independent on-chain tx verification

Keystore-backed session SK - TEE + biometric gate

EMV APDU chain - any contactless Visa or Mastercard

Telegram deep links - HMAC-SHA256, replay-protected

Python skill - OpenClaw, LangChain, CrewAI, Eliza compatible

ATA rent reclaim - ~\$0.17 recovered per session sweep

WHY I BUILT THIS

Hardware wallets shipped with dedicated cards.

I had a different question: why not the one already in my pocket?

My bank card has an NFC chip. My phone has a reader. A weekend with the EMV spec — and an answer.

— A. KOLOV / SOLO BUILD / 4 WEEKS

EXISTING APPROACH

Dedicated hardware card

Solid security. New device to buy, carry, and not lose. Friction at every onboarding step.

TALLY

Your **existing** bank card

ALREADY IN YOUR POCKET

Same security primitive. Zero new hardware. **Onboarding = one tap.**

Full-stack, crypto, NFC, agent integration. **One person.**
